I. Introduction/Description

Entrepreneur Simulator is a simple Java application akin to the famous Cookie Clicker game series, it teaches users to reinvest their money for continued and sustainable economic growth. It allows users to "work" (click) for money and reinvest that money into different investments that can grow overtime (investment profits/revenue). It features two ways to earn money, one for the shop and passive income (investment), and the other for active income ("work" - clicking). The goal of the game is to raise a certain amount of cash as fast as possible. The time it takes to get to that amount will be recorded and be registered in the local leaderboard after the user inputs their desired username.

II. Methodology

- Menus (Major Phase)
 - The developers will start by coding menu option displays, preparing to code for the interactions with the menu objects
- Graphic Interface (Major)
 - The developers will develop the User Interface (UI) of the game that will display the relevant statistics of the player (money, time passed, etc.)
- Game Design (Major)
 - The developers will code in the mechanics and functions used in the game, and tie them to the menu and user interface implemented in the earlier phases
 - Rules:
 - Earn money by starting tasks
 - Use earned money to invest and expand to other businesses and earn more money faster
 - Hire managers along the way to automate certain tasks
 - Reach a certain amount of money in the shortest time possible
 - Additional Features:
 - The Investment Shop
 - Clicking
 - Local Save
 - More to come
- Debugging (Minor)
 - Fixing up the code for any issues to ensure that it works as intended
- Four Pillars (Major)
 - Abstraction
 - Abstraction in this program is done through the use of JavaFX and SceneBuilder, making an application that acts as an interface for the user.

Basically, it creates a graphical user interface to make the program easier to use. This allows the coders (us) to hide the code from the user, but still allow them to use the program through tool interaction.

- Encapsulation
 - Encapsulation is used in this program through the Investment class wherein its attributes are under the protected access modifier. This results in encapsulation as these parameters cannot be edited by external code and can only be modified/accessed by the class objects/instances themselves.
- Inheritance
 - Inheritance is used through the subclasses of the Investment class, specifically all the different investment types in our game (i.e. Lemonade, Dog, Stock, Resto). This allows the subclasses to utilize the attribute characteristics and methods of the Investment class, and makes it easier to update/utilize them due to their similarity to each other under the investment class.
- Polymorphism
 - Polymorphism was demonstrated also through the methods present in the Investment class. What we specifically used was Static Polymorphism/Method Overloading. This allows the “same” method to be called but the return value is determined by the type of variable that was passed through it. This allowed us to utilize the “same” method to update different values when an event is done.

III. Project Description

IPO:

Input	Process	Output
Pressing the Game Start Button	Runs GameStart(ActionEvent event)	Loads “Gamemodes.fxml”
Pressing the Credits Button	Runs Credits(ActionEvent event)	Loads “Credits.fxml”
Pressing the Quit Button	Runs quitButtonClick	Ends the Program
Pressing the “Mode: Elongated Muskrat” Button	Runs muskStart(MouseEvent event)	Loads “Game.fxml” with the gamemode of getting to \$1,000,000,000 as the goal
Pressing the “Mode: Devouring Time” Button	Runs timeStart(MouseEvent event)	Loads “Game.fxml” with the gamemode of earning as much money as possible in 30 minutes as the goal

Pressing the Lemonade Upgrade Button	Checks if the player has enough money to upgrade the component's passive income value	Meets Condition: Subtracts the cost from the player's available money, increases the passive income, and updates the new cost for upgrade, while displaying a yellow border around the button
Pressing the Dog Walk Upgrade Button		
Pressing the Rice Field Upgrade Button		
Pressing the Restaurant Upgrade Button		
Pressing the Real Estate Upgrade Button		
Pressing the Pharmaceuticals Upgrade Button		
Pressing the Sports Team Upgrade Button		Doesn't Meet Condition: Displays a red border around the button
Pressing the Bank Upgrade Button		
Pressing the Space Resort Upgrade Button		
Pressing the Asteroid Mining Upgrade Button		
Pressing the Work Button	Starts the Timer on first click; adds the value of activeIncome to the available money of the player	Updates available money by increasing it by the amount in activeIncome
Pressing the Work Upgrade Button	Checks if the player has enough money to upgrade the active income value	Meets Condition: Subtracts the cost from the player's available money, increases the active income, and updates the new cost for upgrade
		Doesn't Meet Condition: Does Nothing
Clicking on the Score Text	Extracts the type of gamemode to determine what score to display	Elongated Muskrat Mode: Displays the Elapsed Time as the score

IV. Deliverables

TASK TITLE	TASK OWNER	START DATE	DUE DATE	WEEK 8														WEEK 9							WEEK 10							WEEK 11							WEEK 12							WEEK 13

V. Evaluation

The program will be evaluated by how effectively the program runs the game, making sure that the values are accurate with no logic errors, and that the program can recognize when the player reaches the end goal. The program can be further tested via peer-review for an objective, outside the box evaluation.

VI. Conclusion

This game aims to be able to have a rough visualization on what an entrepreneur can reach when they reach their full potential, alongside how much work it theoretically takes to reach that point, allowing them to hopefully understand the effort of current-day entrepreneurs and know whether or not they want to pursue this path.

VII. References

- Adventure Capitalist <https://hyperhippo.com/games/adventure-capitalist/>
- What makes our game stand out compared to other games is that we incorporate 2 subgenres of the game into one, which will utilize split canvas display to make it happen, and that it is a time-trial leaderboard that records how fast a player can

reach a set monetary goal, which other games usually don't have, as they are designed to be endless.

- Cookie Clickers
 - The game won't just be a cookie clicker that requires endless monotonous clicking, but more akin to starting a timer for a task to be able to actually generate revenue.
